Specification

- Herbert Screws have headless design, it means that the screw is completely embedded in the bone, without any protrusions to cause tissue irritation even in intra-articular placement.
- Cannulation helps ensure precise placement of the screw.
- Screws available in both Titanium and Stainless Steel.

Indication for use

- Herbert Screws are designed for the management of fractures where minimal tissue coverage makes standard screw use inappropriate or where extreme precision in fragment alignment is imperative.
- Such locations might include fractures of the:Olecranon and malleolar region

Distal femur

Proximal tibia
